**I. COLUMN 1**

| | | | |
|---|---|---|---|
| Column 1 lines 1-22. | **SIGNAL PROCESSING APPARATUS AND METHODS**<br>**BACKGROUND OF THE INVENTION**<br>At the present time, vast amounts of programing are transmitted through various media throughout the United States which programing is handled with significant degrees of manual processing as different, discrete units of programing transmitted on single channel systems. Broadcasters and cablecasters transmit programing with the expectation that viewers in one place tune to only onechannel at a time.<br>On occasion and on a limited scale, the co-ordination of two media and two channels has occurred. Such co ordination has taken the form of stereo simulcasts where one local television station broadcasts a program, generally of classical music, and simultaneously, a local radio station broadcasts the same music in stereo. But such simulcasts require significant degrees of manual processing at both the points of origination and reception. | Page 7 lines 7-12. | [The prior art] has no capacity for coordinating the programming content transmitted by any given peripheral system with any other programming transmitted to a television receiver. It has no capacity for controlling two separate systems such as, for example, an automatic radio and television stereo simulcast. |
| Column 1 lines 23-28. | Today great potential exists for a significant increase in the scope and scale of multimedia and multichannel presentations. This increase is desirable because it will increase variety and add substantially to the richness of presentations as regards both entertainment and the communications of ideas and information. | Page 2 lines 20-23. | Unlocking this potential is desirable because these new media will add substantial richness and variety to the communication of ideas, information and entertainment. |
| Column 1 lines 29-35. | This potential arises out of two simultaneous, independent trends. One is the development and growth of the so-called cable television industry whose member companies deliver locally not one but many channels of programing. The other is the widespread and growing ownership of computers, especially microcomputers in homes. | Page 2 lines 8-11. | Today great potential exists for combining the capacity of broadcast communications media to convey ideas with the capacity of computers to process and output user specific information. |
| Column 1 lines 36-41. | It is the object of this invention to unlock this potential by the development of means and methods which permit programing to communicate with equipment that is external to television and radio receivers, particularly computers and computer peripherals such as printers. | Page 3 lines 30-33,<br><br>Page 2 line 25 to page 3 line 8. | It is the object of this invention to unlock this great potential in the fullest measure by means of an integrated system of programming communication that joins together all these capacities most efficiently.<br><br>To unlock this potential fully requires means and methods for combining and controlling receiver systems that are now separate--television and computers, radio and computers, broadcast print and computers, television and computers and |

| | | | |
|---|---|---|---|
| | | | broadcast print, etc.<br>But it requires much more.<br>To unlock this potential fully requires a system with efficient capacity for satisfying the demands of subscribers who have little receiver apparatus and simple information demands as well as subscribers who have extensive apparatus and complex demands. It requires capacity for transmitting and organizing vastly more information and programming than any one-channel transmission system can possibly convey at one time. It requires capacity for controlling intermediate transmission stations that receive information and programming from many sources and for organizing the information and programming and retransmitting the information and programming so as to make the use of the information and programming at ultimate receiver stations as efficient as possible. |
| Column 1 lines 42-44 | It is the further purpose of this invention to provide means and methods to process and monitor such transmissions and presentations at individual receiver sites… | Page 3 lines 9-29. | To unlock this potential also requires efficient capacity for providing reliable audit information to (1) advertisers and others who pay for the transmission and performance of programming and (2) copyright holders, pay service operators, and others such as talent who demand, instead, to be paid. This requires capacity for identifying and recording (1) what television, radio, data, and other programming and what instruction signals are transmitted at each transmission station and (2) what is received at each receiver station as well as (3) what received programming is combined or otherwise used at each receiver station and (4) how it is received, combined, and/or otherwise used.<br>Moreover, this system must have the capacity to ensure that programming supplied for pay or for other conditional use is used only in accordance with those conditions. For example, subscriber station apparatus must display the commercials that are transmitted in transmissions that advertisers pay for. The system must have capacity for decrypting, in many varying ways, programming and instruction signals that are encrypted and for identifying those who pirate programming and inhibiting piracy. |
| Column 1 lines 45-49. | …and to control, in certain ways, the use of transmitted programing and the operation of certain associated equipment. Such receiver sites may be stations or systems that intend to retransmit the programing, or they may be end users of the programing. | Page 11 lines 23-27. | It is the further purpose of this invention to provide means and methods whereby a simplex point-to-multipoint transmission (such as a television or radio broadcast) can cause simultaneous generation of user specific information at a plurality of subscriber stations. |

| 1981 Spec Reference | 1981 Language | 1987 Spec Reference | 1987 Language |
|---|---|---|---|
| Column 1 lines 49-53. | The present invention contemplates that certain data may be encrypted and that certain data collected from such processing and monitoring will automatically be transfered to a remote geographic location or locations. | Page 13 lines 5-9. | In the present invention, certain monitored signals may be encrypted, and certain data collected from such monitoring may be automatically transferred from subscriber stations to one or more remote geographic stations. |
| Column 1 lines 54-57. | In the prior art, there have been attempts to develop systems to control programing and systems to monitor programing, but the two have been treated as separate systems, and each has had limited capacity. | Page 2 lines 25-30. | To unlock this potential fully requires means and methods for combining and controlling receiver systems that are now separate--television and computers, radio and computers, broadcast print and computers, television and computers and broadcast print, etc. |
| Column 1 line 58 to column 2 line 27. | As regards control systems, cueing systems and equipment now exist that transmit instructions to operating equipment at receiver sites by means of tone signals that are carried, in television transmissions, in the audio portion and may be heard by the human ear. Such systems and devices are used to turn on equipment such as videotape players and recorders that have been manually loaded and to tell such equipment how long to run. Such systems operate by transmitting operating signals that precede and follow programing and are called "headers" and "trailers" respectively. The use of headers and trailers limits prior art in that headers and trailers can become separated from programing, thereby hampering automatic operations. Such prior art techniques have lacked the capacity to process the programing in various ways including to instruct receiver end equipment what specific programing to select to play or record other than that immediately at hand, how to load it on player or recorder equipment, when and how to play it or record it other than immediately, how to modify it, what equipment or channel or channels to transmit it on, when to transmit it, and how and where to file it or refile it or dispose of it. (Within television studios that are original transmitters of programing, certain systems and equipment do exist for certain automatic co-ordination of players, loaders, and other equipment; however, manual instructions still must be given, on site, for the co-ordination of such equipment which instructions are transmitted electronically on hard- wire channels that are strictly separate from the channels on which the programing is transmitted and such instructions are never broadcast.) Such prior art systems and equipment have lacked the capacity to automatically coordinate multi- hannel and multi-media presentations. They have lacked the capacity to decrypt encrypted | Generally, page 4 line 17 to page 7 line 22. | This prior art is limited. It only transmits data; it does not control data processing. No system is preprogrammed to simultaneously control a plurality of central processor units, operating systems, and pluralities of computer peripheral units. None has capacity to cause simultaneous generation of user specific information at a plurality of receiver stations. None has any capacity to cause subscriber station computers to process received data, let alone in ways that are not inputted by the subscribers. None has any capacity to explain automatically why any given information might be of particular interest to any subscriber or why any subscriber might wish to select information that is not selected or how any subscriber might wish to change the way selected information is processed.<br>...<br>This prior art, too, is limited. It has no capacity to overlay any information other than information transmitted to all receiver stations simultaneously. It has no capacity to overlay any such information except in the order in which it is received. It has no capacity to cause receiver station computers to generate any information whatsoever, let alone user specific information. It has no capacity to cause overlays to commence or cease appearing at receiver stations, let alone commence and cease appearing periodically.<br>As regards the automation of intermediate transmission stations, various so-called "cueing" systems in the prior art operate in conjunction with network broadcast transmissions to automate the so-called "cut-in" at local television and radio stations of locally originated programming such as so-called "local spot" advertisements.<br>...<br>This prior art, too, is limited. It has no capacity to schedule |

| 1981 Spec Reference | 1981 Language | 1987 Spec Reference | 1987 Language |
|---|---|---|---|
| | processing signals. They have lacked the capacity to monitor whether receiver-end equipment are following instructions properly. | | automatically or transmit any programming other than that loaded immediately at the play heads of the controlled video players. It has no capacity to load the video players or identify what programming is loaded on the players or verify that scheduled programs are played correctly. It has no capacity to cause the video players to record programming from any source. It has no capacity to receive programming transmissions or process received transmissions in any way. It has no capacity to operate under the control of instructions transmitted by broadcasters. It has no capacity to insert signals that convey information to or control, in any way, the automatic operation of ultimate receiver station apparatus other than television receivers.<br>...<br>This prior art, too, is limited. It has no capacity for interconnecting or operating a system at any time other than the time when the order to do so is entered manually at the system or remote keyboard. It has no capacity for acting on instructions transmitted by broadcasters to interconnect, actuate or tune systems peripheral to a television receiver or to actuate a television receiver or automatically change channels received by a receiver. It has no capacity for coordinating the programming content transmitted by any given peripheral system with any other programming transmitted to a television receiver. It has no capacity for controlling two separate systems such as, for example, an automatic radio and television stereo simulcast. It has no capacity for selectively connecting radio receivers to radio peripherals such as computers or printers or speakers or for connecting computers to computer peripherals (except perhaps a television set). It has no capacity for controlling the operation of decryptors or selectively inputting transmissions to decryptors or outputting transmissions from decryptors to other apparatus. It has no capacity for monitoring and maintaining records regarding what programming is selected or played on any apparatus or what apparatus is connected or how connected apparatus operate. |

**II. COLUMN 2**

| | | | |
|---|---|---|---|
| Column 2 lines 28-62. | As regards monitoring systems, various systems and devices have been developed to determine what programing | Generally page 7 line 23 to page 9 line 5. | The prior art includes a variety of systems for monitoring programming and generating so-called "ratings." One system |

| | | | |
|---|---|---|---|
| | is played on television. One such system for monitoring programs is described in U.S. Patent to Haselwood, et al. No.4,025,851. Another that monitors by means of audio codes that are only "substantially inaudible" is described in U.S. Patent to Crosby No. 3,845,391. Recently devices, called addressable converters, have been developed that facilitate so-called pay-per-view marketing of programing by monitoring what individual television receivers tune to and either permitting or preventing the tuners to tune to given frequencies satisfactorily. Such prior art techniques and equipment have been limited to monitoring single broadcast stations, channels or units and have lacked the ability to monitor multimedia presentations. They have been able to monitor only the audio or the video portion of television transmissions. They have been able either to monitor what is transmitted over one channel or what is received by one or more receivers but not both. They have lacked the capacity to record and transfer information simultaneously. They have been unable to decrypt encrypted signals. They have been able to monitor only single signal word types or word lengths that are placed, within the transmissions, in locations that are unvarying and unvariable. They have lacked the capacity to compare, assemble, and/or evaluate multi-word, multi-location signals. Except in the possible case of addressable converters, they have been unable to distinguish the absence of signals or signal words in transmissions. They have lacked the capacity to communicate processing instructions to external equipment as described in the paragraph above. It is the object of the present invention to overcome these and other deficiencies of the prior art. | | that monitors by means of embedded digital signals is described in U.S. Patent to Haselwood, et al. No. 4,025,851. Another that monitors by means of audio codes that are only "substantially inaudible" is described in U.S. Patent to Crosby No. 3,845,391. A third that automatically monitors a plurality of channels by switching sequentially among them and that includes capacity to monitor audio and visual quality is described in U.S. Patent to Greenberg No. 4,547,804.<br>This prior art, too, is limited. It has capacity to monitor only single broadcast stations, channels or units and lacks capacity to monitor more than one channel at a time or to monitor the combining of media. At any given monitor station, it has had capacity to monitor either what is transmitted over one or more channels or what is received on one or more receivers but not both. It has assumed monitored signals of particular format in particular transmission locations and has lacked capacity to vary formats or locations or to distinguish and act on the absence of signals or to interpret and process in any fashion signals that appear in monitored locations that are not monitored signals. It has lacked capacity to identify encrypted signals then decrypt them. It has lacked capacity to record and also transfer information to a remote geographic location simultaneously.<br>As regards recorder/player systems, many means and methods exist in the prior art for recording television or audio programming and/or data on magnetic, optical or other recording media and for retransmitting prerecorded programming. Video tape recorders have capacity for automatic delayed recording of television transmissions on the basis of instructions input manually by viewers. So-called "interactive video" systems have capacity for locating prerecorded television programming on a given disc and transmitting it to television receivers and locating prerecorded digital data on the same disc and transmitting them to computers.<br>This prior art, too, is limited. It has no capacity for automatically embedding signals in and/or removing embedded signals from a television transmission then recording the transmission. It has no capacity for controlling the connection or actuation or tuning of external apparatus. It has no capacity for retransmitting prerecorded |

| | | | |
|---|---|---|---|
| | | | programming and controlling the decryption of said programming, let alone doing so on the basis of signals that are embedded in said programming that contain keys for the decryption of said programming. It has no capacity for operating on the basis of control signals transmitted to recorder/players at a plurality of subscriber stations, let alone operating on the basis of such signals to record user specific information at each subscriber station. |
| Column 2 lines 63-64. | (The term "signal unit" hereinafter means one complete signal instruction or information message unit. | Page 14 lines 26-27. | (The term "signal unit" hereinafter means one complete signal instruction or information message unit. |
| Column 2 lines 65-66. | Examples of signal units are a unique code identifying a programing unit,... | Page 14 lines 27-29. | Examples of signal units are a unique code identifying a programming unit, .... |
| Column 2 lines 66-67. | ...or a unique purchase order number identifying the proper use of a programing unit,... | Page 14 lines 27-30. | Examples of signal units are...a unique purchase order number identifying the proper use of a programming unit, or .... |
| Column 2 line 67 to column 3 line 3. | ...or a general instruction identifying whether a programing unit is to be retransmitted immediately or recorded for delayed transmission. | Page 14 lines 27-32. | Examples of signal units are...a general instruction identifying whether a programming unit is to be retransmitted immediately or recorded for delayed transmission. |

**III. COLUMN 3**

| | | | |
|---|---|---|---|
| Column 3 lines 3-5. | The term "signal word" hereinafter means one full discrete appearance of a signal as embedded at one time in one location on a transmission. | Page 14 lines 32-35. | The term "signal word" hereinafter means one full discrete appearance of a signal as embedded at one time in one location on a transmission. |
| Column 3 lines 6-8. | Examples of signal words are a string of one or more digital data bits encoded together on a single line of video or sequentially in audio. | Page 14 line 35 to page 15 line 2. | Examples of signal words are a string of one or more digital data bits encoded together on a single line of video or sequentially in audio. |
| Column 3 lines 8-12. | Such strings may or may not have predetermined data bits to identify the beginnings and ends of words. Signal words may contain parts of signal units, whole signal units, or groups of partial or whole signal units or combinations.) | Page 15 lines 2-6. | Such strings may or may not have predetermined data bits to identify the beginnings and ends of words. Signal words may contain parts of signal units, whole signal units, or groups of partial or whole signal units or combinations.) |
| Column 3 lines 13-27. | It is a further object of the present invention to process and monitor signals on numerous channels by sequentially scanning each channel in a predetermined manner which manner may be varied. It is also an object of the present invention to prevent unauthorized use of signals and programing by permitting signal encryption, the variation of word numbers, word lengths, word compositions, and/or word locations. It is also an object of this system to process different signal words in different ways. It is also an object of | Page 3 lines 21-2\\9. | Moreover, this system must have the capacity to ensure that programming supplied for pay or for other conditional use is used only in accordance with those conditions. For example, subscriber station apparatus must display the commercials that are transmitted in transmissions that advertisers pay for. The system must have capacity for decrypting, in many varying ways, programming and instruction signals that are encrypted and for identifying those who pirate programming and inhibiting piracy. |

| | | | |
|---|---|---|---|
| Column 3 lines 45-47. | The method permits the transfer of such records to a predetermined site or sites in a predetermined fashion or fashions. | Page 337 lines 19-21 | And said signal processor apparatus can transmit such records of programming to remote sites via telephone or other data transfer networks, 97 and 99 respectively. |
| Column 3 lines 48-51. | Another method has application at receiver sites such as private homes or public places like theaters, hotels, brokerage offices, etc., whether commercial establishments or not. | Page 12 lines 30-35. | It is the further purpose of this invention to provide means and methods for the automation of ultimate receiver stations, ... Such ultimate receiver stations may be private homes or offices or commercial establishments such as theaters, hotels, or brokerage offices. |
| Column 3 lines 51-56. | This method provides techniques whereby, automatically, single channel, single medium presentations, be they television, radio, or other electronic transmissions, may be recorded, co-ordinated in time with other programing previously transmitted and recorded, or processed in other fashions. | Page 12 lines 30-33. | It is the further purpose of this invention to provide means and methods for the automation of ultimate receiver stations, especially the automation of combined medium and multi-channel presentations. |
| | | Page 2 lines 8-19. | Today great potential exists for combining the capacity of broadcast communications media to convey ideas with the capacity of computers to process and output user specific information. One such combination would provide a new radio-based or broadcast print medium with the capacity for conveying general information to large audiences--e.g., "Stock prices rose today in heavy trading,"--with information of specific relevance to each particular user in the audience--e.g., "but the value of your stock portfolio went down." (Hereinafter, the new media that result from such combinations are called "combined" media.) |
| | | Page 2 lines 26-30. | ... methods for combining and controlling receiver systems that are now separate--television and computers, radio and computers, broadcast print and computers, television and computers and broadcast print, etc. |
| | | Page 13 lines 10-13. | It is a further purpose of this invention to provide means and methods for recording combined media and/or multi-channel programming and for playing back prerecorded programming of such types. |
| Column 3 lines 56-60. | Multimedia presentations may be co-ordinated in time and/or in place as, for example, when real-time video programing is co-ordinated with presentations from a microcomputer working with data supplied earlier. | Page 12 lines 3-9. | It is the further purpose of this invention to provide means and methods whereby a simplex broadcast transmission can cause periodic combining of relevant user specific information and conventional broadcast programming simultaneously at a plurality of subscriber stations, thereby integrating the broadcast information with each user's own information. |

| 1981 Spec Reference | 1981 Language | 1987 Spec Reference | 1987 Language |
|---|---|---|---|
| | | Page 2 lines 8-19. | Today great potential exists for combining the capacity of broadcast communications media to convey ideas with the capacity of computers to process and output user specific information. One such combination would provide a new radio-based or broadcast print medium with the capacity for conveying general information to large audiences--e.g., "Stock prices rose today in heavy trading,"--with information of specific relevance to each particular user in the audience--e.g., "but the value of your stock portfolio went down." (Hereinafter, the new media that result from such combinations are called "combined" media.) |
| | | Page 28 lines 2-3. | This television based combined medium is but one example of many combined media. |
| Column 3 lines 60-66. | This method provides techniques whereby the timing and fashion of the playing, processing, and co-ordination of a presentation or presentations may be determined at the time and place of transmission or of presentation, either in whole or in part, either locally or remotely, or a combination of these factors. | Page 11 lines 23-31. | It is the further purpose of this invention to provide means and methods whereby a simplex point-to-multipoint transmission (such as a television or radio broadcast) can cause simultaneous generation of user specific information at a plurality of subscriber stations. One advantage of the present invention is great ease of use. For example, as will be seen, a subscriber can cause his own information to be processed in highly complex ways by merely turning his television receiver on and tuning to a particular channel. |
| | | Page 450 lines 27-35. | (To accomplish all this has required only that the subscriber of microcomputer, 205, [and other subscribers at other stations] cause the installation and connection of the apparatus shown in the figures of this submission, especially Fig. 7 (and 7C); caused his microcomputer, 205, to be preprogrammed as described above; and preinformed microcomputer, 205, of his wish to view said "Wall Street Week" program by causing the aforementioned select-WSW information to be recorded at said microcomputer, 205.) .... |
| Column 3 line 66 to column 4 line 2. | The method provides monitoring techniques to develop data on patterns of viewership and to permit the detemination of specific usage at individual receiving sites for various purposes including, for example, the billing of individual customers. | Page 13 lines 1-9. | It is the further purpose of this invention to provide means and methods for identifying and recording what television, radio, data, and other programming is transmitted at each transmission station, what programming is received at each receiver station, and how programming is used. In the present invention, certain monitored signals may be encrypted, and certain data collected from such monitoring may be automatically transferred from subscriber stations to one or more remote geographic stations. |

| | | | |
|---|---|---|---|
| | | Page 28 lines 29-35. | It has capacity for transferring said meter records automatically to one or more remote automated billing stations that account for programming and information consumption and bill subscribers and said monitor records automatically to one or more remote so-called "ratings" stations that collect statistical data on programming availability and usage. |

| | | | have means and are preprogrammed to process at register memory execution segment information of varying lengths of binary information. |
| Column 4 lines 31-33. | The present invention provides a method for obscuring the meaning of the signals to prevent unauthorized use of the signals and of their associated programing. | Page 13 lines 14-17. | It is a further purpose of this invention to provide a variety of means and methods for restricting the use of transmitted communications to only duly authorized subscribers. |
| Column 4 lines 34-36. | Their meanings may be obscured through encryption so that apparatus described below are necessary to decrypt them. | Page 13 lines 17-19. | Such means and methods include techniques for encrypting programming and/or instructions and decrypting them at subscriber stations. |
| Column 4 lines 36-40. | In addition, the pattern of the composition, timing, and location of the signals may vary in such ways that only receiving apparatus that are preinformed regarding the patterns that obtain at any given time will be able to process the signals correctly. | Page 13 lines 19-24. | They also include techniques whereby the pattern of the composition, timing, and location of embedded signals may vary in such fashions that only receiving apparatus that are preinformed regarding the patterns that obtain at any given time will be able to process the signals correctly. |
| Column 4 lines 40-46. | Both the arrangement of signal units in signal words and the locations, timings, and lengths of signal words in individual transmissions or groups of transmissions may vary in fashions that can only be interpreted accurately by apparatus that are preprogramed with the keys to such variations. | Page 14 lines 10-25. | … [signals] will probably lie outside the range of the television picture displayed on a normally tuned television set. In television and radio they may appear in a portion of the audio range that is not normally rendered in a form audible to the human ear. In television audio, they are likely to lie between eight and fifteen kilohertz. In broadcast print and data communications transmissions, the signals may accompany conventional print or data programming in the conventional transmission stream but will include instructions that receiver station apparatus are preprogrammed to process that instruct receiver apparatus to separate the signals from the conventional programming and process them differently. In all cases, signals may convey information in discrete words, transmitted at separate times or in separate locations, that receiver apparatus must assemble in order to receive one complete instruction. |
| | | Page 60 line 19 to page 61 line 1. | SPAM messages are composed of elements—headers, execution segments, meter-monitor segments, and information segments--whose bit lengths vary. SPAM apparatus determine the bit length of said elements in different fashions, and the particular fashion that applies to any given element relates to the priority of said element for subscriber station speed of processing. First priority segment information has the highest priority for speedy processing and is of fixed binary bit length. A SPAM header is one example of a first priority segment. An execution segment is another example. Intermediate priority segment information |

| | | | |
|---|---|---|---|
| | | | has lower priority, varies in bit length, but contains internal length information. A Meter-monitor segment is one example of an intermediate priority segment. Lowest priority segment information has the lowest priority, varies in length, and contains no internal information for determining segment length. Each information segment is an example of a lowest priority segment. |
| | | Page 91 lines 18-20. | All subscriber station apparatus are fully preprogrammed to perform automatically each step of each example. No manual step is required at any station. |

| Column 6 lines 20-41. | **Description of the Preferred Embodiments**<br>The Signal Processor Apparatus<br>A signal processor apparatus for simultaneous use with a cablecast input that conveys both television and radio programing and a broadcast television input is shown in Figure 1. As shown, the input signals are the entire range of frequencies or channels transmitted on the cable and the entire range of broadcast television transmissions available to a local television antenna of conventional design. The cable transmission is input simultaneously to switch 1 and mixer 2. The broadcast transmission is input to switch 1. Switch 1 and mixers 2 and 3 are all controlled by local oscillator and switch control 6. The oscillator, 6, is controlled to provide a number of discrete specified frequencies for the particular radio and television channels required. The switch, 1, acts to select the broadcast input or the cablecast input and passes transmissions to mixer 3 which, with the controlled oscillator, 6, acts to select a television frequency of interest that is passed at a fixed frequency to a TV signal decoder, 30. | Page 29 lines 4-26. | Fig. 2 shows one embodiment of a signal processor. Said processor, 26, is configured for simultaneous use with a cablecast input that conveys both television and radio programming and a broadcast television input.<br>At switch, 1, and mixers, 2 and 3, signal processor, 26, monitors all frequencies or channels available for reception at the subscriber station of Fig. 2 to identify available programming. The inputted information is the entire range of frequencies or channels transmitted on the cable and the entire range of broadcast television transmissions available to a local television antenna of conventional design. The cable transmission is inputted simultaneously to switch, 1, and mixer, 2. The broadcast transmission is inputted to switch, 1. Switch, 1, and mixers, 2 and 3, are all controlled by local oscillator and switch control, 6. The oscillator, 6, is controlled to provide a number of discrete specified frequencies for the particular radio and television channels required. The switch, 1, acts to select the broadcast input or the cablecast input and passes transmissions to mixer, 3, which, with the controlled oscillator, 6, acts to select a television frequency of interest that is passed at a fixed frequency to a TV signal decoder, 30. |
| Column 6 lines 42-57. | Decoder 30 is shown more fully in Figure 2A. In the decoder, 30, the frequency passes first through filter 31 which defines the particular channel of interest to be analyzed. The television channel signal is then transmitted to a standard amplitude demodulator, 32, which uses standard demodulator techniques well known in the art to define the television base band signal. This base band signal is then transmitted through | Page 34 line 21 to page 35 line 35. | Fig. 2A shows a TV signal decoder that detects signal information embedded in an inputted television frequency, renders said information into digital signals that subscriber station apparatus can process, identifies the particular apparatus to which said signals are addressed, and outputs said signals to said apparatus. Decoder, 203, in Fig. 1 is one such TV signal decoder; decoder, 30, in Fig. 2 is another. |

| | | | |
|---|---|---|---|
| | separate paths to three separate detector devices. These separate detectors are designed to act on the particular frequency ranges in which the encoded information may be found. The first path, designated A, inputs to a standard line receiver, 33, well known in the art. This line receiver, 33, detects the existance of an embedded signal or signals in one or more of the lines normally used to define a television picture. | | In Fig. 2A, a selected frequency is inputted at a fixed frequency to said decoder at filter, 31, which defines the particular channel of interest to be analyzed. The television channel signal then passes to a standard amplitude demodulator, 32, which uses standard demodulator techniques, well known in the art, to define the television base band signal. This base band signal is then transferred through separate paths to three separate detector devices. The apparatus of these separate paths are designed to act on the particular frequency ranges in which embedded signal information may be found. The first path, designated A, detects signal information embedded in the video information portion of said television channel signal. Path A inputs to a standard line receiver, 33, well known in the art. Said line receiver, 33, receives the information of one or more of the lines normally used to define a television picture. It receives the information only of that portion or portions of the overall video transmission and passes said information to a digital detector, 34, which acts to detect the digital signal information embedded in said information, using standard detection techniques well known in the art, and inputs detected signal information to controller, 39, which is considered in greater detail below. The second path, designated B, detects signal information embedded in the audio information portion of said television channel signal. Path B inputs to a standard audio demodulator, 35, which uses demodulator techniques, well known in the art, to define the television audio transmission and transfers said audio information to high pass filter, 36. Said filter, 36, defines and transfers to digital detector, 37, the portion of said audio information that is of interest. The digital detector, 37, detects signal information embedded in said audio information and inputs detected signal information to controller, 39. The third path, designated C, inputs the separately defined transmission to a digital detector, 38, which detects signal information embedded in any other information portion of said television channel signal and inputs detected signal information to controller, 39. Line receiver, 33; high pass filter, 36; detectors, 34, 37, and 38; and controller, 39, all operate under control of controller, 39, and in preprogrammed fashions that may be changed by controller, 39. |
| Column 6 lines 57-61. | It receives and detects only that portion or portions of the overall video transmission and passes this line portion or portions to a digital detector, **34**, which acts to decode the encoded signal information in the line portion or portions. | Page 354 line 16-33. | Receiving the inputted frequency of interest of wireless channel 5 at decoder, 30, causes filter, 31, to filters the inputted fixed frequency and output the one TV channel signal of channel 5 to amplitude demodulator, 32; causing demodulator, 32, to |

| | | | |
|---|---|---|---|
| | | | demodulate said inputted channel signal and transfer the demodulated signal to line receiver, 33; causing line receiver, 33, to detect said embedded signal information and transmit it to digital detector, 34; causing digital detector, 34, to detect the binary information of said signal information and transfer said binary information to controller, 39. Receiving said binary information at controller, 39, causes the binary SPAM information of the wireless channel 5 transmission to be checked and corrected, as necessary, at processor, 39B; converted into locally usable binary information at processor, 39D; and checked for end of file signal information at EOFS valve, 39F, and transmitted to the null output of matrix switch, 39I, until EOFS valve, 39F, detects an end of file signal. |
| Column 6 line 61 to column 7 line 1. | The base band signal is also inputted through path B to an audio demodulator, **35**, which further inputs a high pass filter, **36**, and a digital detector, **37**. The digital detector, **37**, through standard detection techniques well known in the art, determines whether a particular signal is present in the transmission in a pre- determined fashion. Path C inputs the separately defined transmission to a digital detector, **38**. | Page 34 line 21 to page 35 line 35. | *See reference above.* |

**VII. COLUMN 7**

| | | | |
|---|---|---|---|
| Column 7 lines 1-5. | Detectors, **34**, **37**, and **38**, line receiver, **33**, and high pass filter, **36**, all operate in predetermined fashions which fashions may be changed by external controller, **20** (referring to Fig. **1**), to be described below. | Page 35 lines 31-35.<br><br>Page 33 lines 18-21. | Line receiver, 33; high pass filter, 36; detectors, 34, 37, and 38; and controller, 39, all operate under control of controller, 39, and in preprogrammed fashions that may be changed by controller, 39.<br><br>Controller, 20, has capacity for controlling the operation of all elements of the signal processor and can receive operating information from said elements. |
| Column 7 lines 6-11. | If one returns to FIG. **1**, one sees that the three separate lines of information outputted from TV signal decoder, **30**, are then gated to a buffer/comparator, **8**, which also receives other inputs from the other separate receivers comprising similar filters, demodulators, and decoders for other channels of interest. | Page 29 line 33 to page 30 line 5. | Decoder, 30, which is shown in detail in Fig. 2A, and decoder, 40, which is shown in Fig. 2B, detect signal information embedded in the respective inputted television and radio frequencies, ... and output said signals and said modified signals to buffer/comparator, 8. |
| Column 7 lines 12-15. | One such other path is that from mixer **2**. Mixer **2** and the controlled oscillator, **6**, act to select a radio frequency of interest which is inputted to a radio signal decoder, **40**,... | Page 29 lines 26-29. | Simultaneously, mixer, 2, and the controlled oscillator, 6, act to select a radio frequency of interest which is inputted to a radio signal decoder, 40. |
| Column 7 lines 15-18. | ...shown in FIG. **2B**. The frequency passes first through | Page 36 lines 1-14. | Fig. 2B shows a radio signal decoder that detects and |

| | | | |
|---|---|---|---|
| | standard radio receiver circuitry, **41**, well known in the art, a radio decoder, **42**, and a standard digital detector, **43**. | | processes signal information embedded in an inputted radio frequency. Decoder, 40, in Fig. 2 is one such radio signal decoder. A selected frequency of interest is inputted at a fixed frequency to standard radio receiver circuitry, 41, which receives the radio information of said frequency using standard radio receiver techniques, well known in the art, and transfers said radio information to radio decoder, 42. Radio decoder, 42, decoders the signal information embedded in said radio information and transfers said decoded information to a standard digital detector, 43. Said detector, 43, detects the binary signal information in said decoded information and inputs said signal information to controller, 44, discussed more fully below. |
| Column 7 lines 18-20. | All operate in predetermined fashions that may be changed by external controller, **20** (referring to Fig. **1**). | Page 36 lines 14-17.<br><br>Page 33 lines 18-21. | Circuitry, 41; decoder, 42; and detector, 43, all operate under control of controller, 44, and in predetermined fashions that may be changed by controller, 44.<br><br>Controller, 20, has capacity for controlling the operation of all elements of the signal processor and can receive operating information from said elements. |
| Column 7 lines 20-21. | As FIG. **1** shows, the radio signal detector outputs to buffer/comparator **8**. | Page 29 line 32 to page 30 line 5. | Decoder, 30, which is shown in detail in Fig. 2A, and decoder, 40, which is shown in Fig. 2B, detect signal information embedded in the respective inputted television and radio frequencies, ... and output said signals and said modified signals to buffer/comparator, 8. |
| Column 7 lines 22-24. | (The signal processor apparatus described here is configured to receive broadcast TV transmissions and cablecast TV and radio transmissions. | Page 29 lines 4-7. | Fig. 2 shows one embodiment of a signal processor. Said processor, 26, is configured for simultaneous use with a cablecast input that conveys both television and radio programming and a broadcast television input. |
| Column 7 lines 24-30. | Were it desirable to process signals in other transmissions such as broadcast microwave transmissions or cablecast transmissions on other than standard TV and radio frequencies, the mixers and switches would be appropriately reconfigured and one or more other signal decoders as described in FIG. **2C** would be added. | Page 33 lines 26-33. | ... a signal processor can monitor any combination of inputs and transmission frequencies, and the signal processor of Fig. 2 is but one embodiment of a signal processor. Other embodiments can receive and monitor available programming in transmission frequencies other than radio and television frequencies through the addition of one or more other signal decoders such as that of Fig. 2C described below. |
| Column 7 lines 30-34. | As FIG. **2C** shows, the desired frequencies would pass through appropriate other receiver circuitry, **45**, well known in the art, and an appropriate digital detector, **46**, before being outputted to buffer/comparator **8**. | Page 36 lines 18-29. | Fig. 2C shows a signal decoder that detects and processes signal information embedded in a frequency other than a television or radio frequency. A selected other frequency (such as a microwave frequency) is inputted to appropriate other receiver circuitry, 45, well known in the art. Said |

| Column 7 lines 36-37. | Buffer/comparator, **8**, organizes the data stream that it receives according to a pre-determined fashion... | Page 30 lines 7-9.<br><br>Page 36 line 32 to page 37 line 3. | Buffer/comparator, 8, receives said signals from said decoders and other signals from other inputs and organizes the received information in a predetermined fashion.<br><br>Each decoder is controlled by a controller, 39, 44, or 47, that has buffer, microprocessor, ROM, and RAM capacities. Said buffer capacity of controller, 39, 44, or 47, includes capacity for ... organizing, ... inputs .... |
| Column 7 lines 37-39. | ...that enables buffer/comparator, **8**, among other things, to assemble signal units from signal words. | Page 37 lines 22 to page 38 line 10. | Controller, 39, 44, or 47, is preprogrammed to receive units of signal information, to assemble said units into signal words that subscriber station apparatus can receive and process, and to transfer said words to said apparatus. In each decoder, the controller, 39, 44, or 47, receives detected digital information from the relevant detector or detectors, 34, 37, 38, 43, and 46. Upon receiving any given instance of signal information, controller, 39, 44, or 47, is preprogrammed to process said information automatically. Controller, 39, is preprogrammed to discard received duplicate, incomplete, or irrelevant information; to correct errors in retained received information by means of forward error correction techniques well known in the art; to convert, as may be required, the corrected information, by means of input protocol techniques well known in the art, into digital information that subscriber station apparatus can receive and process; to modify selectively particular corrected and converted information in a predetermined fashion or fashions; to identify in a predetermined fashion or fashions subscriber station apparatus to which said signal information should be transferred; and to transfer said signals to said |

| | | | |
|---|---|---|---|
| | | | apparatus. Said controller, 39, 44, or 47, has one or more output ports for communicating signal information to said apparatus. |
| | | Page 156 line 33. | Fig. 3A shows one such preferred controller, 39. |
| | | Page 157 lines 5-7. | Buffer, 39C, and processor, 39D, are the second buffer and processor and perform protocol conversion functions. |
| | | Page 14 lines 22-25. | In all cases, signals may convey information in discrete words, transmitted at separate times or in separate locations, that receiver apparatus must assemble in order to receive one complete instruction. |
| Column 7 lines 39-43. | In a pre-determined fashion, buffer/comparator, **8**, identifies signal words and/or signal units that must be decrypted, either in whole or in part, and passes identified signal words and/or units to decrypter, **10**. | Page 30 lines 21-26. | In a fashion described more fully below, buffer/comparator, 8, and a controller, 20, which, too, is described more fully below, determine whether signal processor, 26, is enabled to decrypt said information. If signal processor, 26, is so enabled, buffer/comparator, 8, transfers said information to decryptor, 10. |
| Column 7 lines 43-46. | Decrypter, **10**, uses conventional decrypter techniques, well known in the art, in a pre-determined fashion to decrypt such signals as required. | Page 30 lines 31-35. | Decryptor, 10, is a standard digital information decryptor, well known in the art, that ... uses conventional decryptor techniques, well known in the art, to decrypt said signals as required. |
| Column 7 lines 46-47. | Decrypter, **10**, then passes the decrypted signals to processor or monitor, **12**. | Page 30 line 35 to page 31 line 1. | Decryptor, 10, transfers decrypted signals to controller, 12. |
| Column 7 lines 47-49. | Buffer/comparator, **8**, passes signal words and units not identified as requiring decryption directly to processor or monitor, **12**. | Page 30 lines 29-30. | Buffer/comparator, 8, transfers signals that do not require decryption directly to processor or controller, 12. |
| Column 7 lines 50-54. | Processor or monitor, **12**, analyzes, in a pre-determined fashion, the signal words and units that it receives and determines whether they are to be passed to external equipment or to buffer/comparator, **14**, for further processing or both. | Page 31 lines 10-14. | Controller, 12, receives the signals inputted from buffer/comparator, 8, and decryptor, 10; analyzes said signals in a predetermined fashion; and determines whether they are to be transferred to external equipment or to buffer/comparator, 14, or both. |
| Column 7 lines 54-58. | If a signal or signals are to be passed externally, processor unit, **12**, identifies, in a pre-determined fashion, the external equipment to which the signal or signals are addressed and passes them to appropriate jack ports for external transmission. | Page 31 lines 14-18. | If a signal or signals are to be transferred externally, in a predetermined fashion controller, 12, identifies the external apparatus to which the signal or signals are addressed and transfers them to the appropriate port or ports for external transmission. |
| Column 7 lines 59-60. | If they are to be processed further, processor or monitor, **12**, passes them to buffer/comparator, **14**. | Page 31 lines 18-22. | If they contain meter and/or monitor information and are to be processed further, controller, 12, selects, assembles, and transfers the appropriate information to buffer/comparator, 14. |

|---|---|---|---|
| | | | a particular predetermined period of time has elapsed from the input of wireless channel 9 to decoder, 30, controller, 20, … causes oscillator, 6, to cause the selection of the next channel in the predetermined television channel selection pattern: wireless channel 13. |
| Column 9 lines 53-55. | The local oscillator, being thus sequenced, will allow each signal decoder, **30** and **40**, to receive a particular frequency at a particular time interval. | Page 257 line 24 to page 258 line 19. | Said detection-complete information causes controller, 20, to cause oscillator, 6, to cause the selection of the next channel in the predetermined television channel selection pattern: wireless channel 9. Automatically oscillator, 6, causes mixer, 3, to select the frequency of channel 9 and input said frequency of interest, at a fixed frequency, to decoder, 30 …<br>Controller, 20, has capacity for keeping track of elapsed time, and after determining in a predetermined fashion that a particular predetermined period of time has elapsed from the input of wireless channel 9 to decoder, 30, controller, 20, … causes oscillator, 6, to cause the selection of the next channel in the predetermined television channel selection pattern: wireless channel 13.<br><br>Said radio-detection-complete information causes … controller, 20, to cause oscillator, 6, to cause the selection of the next frequency in the predetermined radio frequency selection pattern: 99.0 MHz. Automatically oscillator, 6, causes mixer, 2, to select said frequency and input it, at a fixed frequency, to decoder, 40 …<br>After determining, in a predetermined fashion, that a particular predetermined period of time has elapsed from the input of said 99.0 MHz frequency to decoder, 40, controller, 20, … causes oscillator, 6, to cause the selection of the next frequency in the predetermined radio frequency selection pattern: 100.0 MHz. |
| | | Page 265 line 27 to Page 266 line 21. | |
| Column 9 lines 55-57. | This will define the timing of the composite outputs of the digital detectors, **34**, **37**, and **38** in FIG. **2A**, and **43** in FIG. **2B**. | Page 250 lines 13-17. | Example #5 begins with the embedding and transmitting, at the remote station that originates the "Wall Street Week" broadcast, of the first message of the "Wall Street Week" program which is the message of the first combining synch command. |
| | | Page 251 lines 8-11. | Receiving said embedded information causes the binary SPAM information of said first command, with error correcting information, to be detected at detector, 34; … |

| | | | |
|---|---|---|---|
| | | Page 263 lines 19-24. | ... said information to radio decoder, 42, which decodes the the embedded signal information of said command and transmits said signal information to digital detector, 43, which detects the binary information with error correcting bit information of said command and transfers said binary and bit information to controller, 44. |
| | | Page 37 lines 26-28. | In each decoder, the controller, 39, 44, or 47, receives detected digital information from the relevant detector or detectors, 34, 37, 38, 43, and 46. |
| Column 9 lines 57-63. | The same controller will control buffer/comparator, **8**, to discard received duplicate and partial signals, to mark signals with correct channel identifiers, to transfer signals to decrypter, **10**, and processor or monitor, **12**, as required, and to perform such other functions as buffer/ comparator, **8**, performs. | Page 146 line 31 to page 147 line 3. | Said failures to match cause the controllers, 20, of said stations automatically ... to cause said buffer/comparators, 8, to discard all received information of said second message; and to cause ... said buffer/comparators, 8, to commence processing in the conventional fashion.) |
| | | Page 258 lines 17-25. | ... causes oscillator, 6, to cause the selection of the next channel in the predetermined television channel selection pattern: wireless channel 13. Automatically, oscillator, 6, causes mixer, 3, to select the frequency of channel 13 and input said frequency to decoder, 30. Controller, 20, then transmits a particular preprogrammed wireless-13 instruction to said control processor, 39J, that informs said processor, 39J, wireless channel 13 is inputted to decoder, 30. |
| | | Page 260 lines 5-13. | ... commence transferring information from control processor, 39J, to buffer/comparator, 8, then to transmit a message that consists of binary information of a "00" header then the execution segment information of the pseudo command then a meter-monitor segment containing said monitor information in RAM (including the associated channel mark and the format information of said information) then any padding bits required to end said message. (Hereinafter, said message is called the "3rd-old-program-message (#5)".) |
| | | Page 147 lines 29-31. | Then said decrypt-with-J instructions cause controller, 20, to activate the output capacity of buffer/comparator, 8, that outputs to decryptor, 10; |

| | | | |
|---|---|---|---|
| | | Page 149 lines 17-20.<br><br>Page 149 lines 27-29. | Next said decrypt-a-00-header-message instructions cause<br>controller, 20, to cause buffer/comparator, 8, to transfer to decryptor, 10, a quantity of signal words of said binary information of the second message …<br><br>Decryptor, 10, commences receiving said information, decrypting it using said key J information and transferring it to controller, 12, … |
| Column 9 lines 63-65. | The controller, **20**, instructs decrypter, **10**, what to decrypt and in what fashion. | Page 147 lines 23-28.<br><br>Page 149 line 27 to page 150 line 6. | Among said preprogrammed instructions is key information of J, and said instructions cause controller, 20, automatically to select and transfer said key information to decryptor, 10.<br>Decryptor, 10, receives said key information and automatically commences using it as its key for decryption.<br><br>Decryptor, 10, commences receiving said information, decrypting it using said key J information and transferring it to controller, 12, as quickly as controller, 12, accepts it. The process of decryption proceeds in a particular fashion. Said decrypt-a-00-header-message instructions cause controller, 20, to cause decryptor, 10, to transfer the first H bits without decrypting or altering said bits in any fashion, to decrypt and transfer the next X bits, to transfer the next L bits without decrypting or altering said bits, to decrypt and transfer the next MMS-L bits, and finally, to transfer any bits remaining after the last of said MMS-L bits without decrypting or altering said bits. In this fashion, the cadence information in said message, which is not encrypted, is transferred by decryptor, 10, to controller, 12, without alteration. |
| Column 9 lines 65-68. | [Controller, 20] instructs processor or monitor, **12**, how to identify what signals to pass externally and where to pass them and what signals to transfer to buffer/comparator, **14**. | Page 149 lines 8-16. | Then said decrypt-a-00-header-message instructions cause controller, 20, to transmit to controller, 12, a particular *transfer-decrypted-message instruction* and particular decryption mark information of key J that identifies J as the decryption key.<br>Receiving said instruction and information causes controller, 12, to execute particular preprogrammed *transfer- and-meter instructions* then record said mark of key J at particular decryption-mark-@12 register memory. |

| | | | |
|---|---|---|---|
| | | Page 150 lines 7-9. | Under control *of said transfer-and-meter instructions,* controller, 12, commences receiving decrypted information of the second message from decryptor, 10. |
| | | Page 150 lines 16-21. | Automatically controller, 12, processes said information of the second message of example #2 as a SPAM command. Receiving the header and execution segment causes controller, 12, to determine that said message is addressed to URS microcomputers, 205, and to transfer said message accordingly. |
| | | Page 152 line 18 to page 153 line 1. | Receiving said complete-transfer-phase instruction causes controller, 12, to cease transferring information, under control *of said transfer-and-meter instructions,* to deactivate all output ports, and to commence executing the meter instructions of said transfer-and-meter instructions. Said meter instructions cause controller, 12, to ... transfer to buffer/comparator, 14, particular header identification information that identifies controller, 12, as the source of said transfer the information recorded at said SPAM-meter memory then the information recorded at said decryption-mark- @12 register memory, which information is the decryption mark of key J. (Hereinafter, said meter information generated by the second combining synch command in example #2 is called the "2nd meter information (#2).") |
| Column 9 line 68 to column 10 line 2. | The controller, **20**, instructs buffer/comparator, **14**, what signals to discard and how to mark signals and assemble signal strings. | Page 32 lines 20-21. | Buffer/comparator, 14, operates under control of controller, 20, ... |
| | | Page 223 lines 22-33. | Said match causes controller, 20, to execute said instructions. Under control of said first set, controller, 20, initiates assembly of said first meter record by selecting and placing at particular record locations at buffer/comparator, 14, particular record format information, then program unit information from a particular meter-monitor field of said 1st meter & monitor information (#4), origin of transmission information from a second field, date and time of transmission information from a third field, decryption key information from the decryption mark of said 1st meter & monitor information |

| | | | |
|---|---|---|---|
| | | Page 224 lines 12-18. | (#4), and finally date and time of processing information from clock, 18.<br><br>When said second set is completed, controller, 20, executes said third specified set which causes controller, 20, to cause buffer/comparator, 14, to transfer said second meter record to recorder, 16, in a predetermined fashion then discard all information of said record from its memory and to cause recorder, 16, to process and record said transferred meter record in its preprogrammed fashion. |

**X. COLUMN 10**

| | | | |
|---|---|---|---|
| Column 10 lines 2-4. | The controller activates digital recorder, **16**, thus defining the location in memory of each of the signals and signal strings. | Page 224 lines 12-18. | When said second set is completed, controller, 20, executes said third specified set which causes controller, 20, to cause buffer/comparator, 14, to transfer said second meter record to recorder, 16, ... and to cause recorder, 16, to process and record said transferred meter record in its preprogrammed fashion. |
| Column 10 lines 4-8. | The controller, **20**, also controls the automatic telephone dialing device, **24**, which can automatically output the digital information on the digital recorder, **12**, to a remote site through a telephone connection, **22**. | Page 273 lines 6-11.<br><br>Page 273 lines 21-25. | Controller, 20, transfers the telephone number, 1-800-AUDITOR, to auto dialer, 24, and causes said dialer, 24, to dial said number. Said first computer answers said telephone call, and in a fashion well known in the art, controller, 20, and said first computer automatically establish telephone communications.<br><br>...causes controller, 20, to cause recorder, 16, to transmit all recorded meter audit records and particular other audit information to telephone connection, 22, which causes said connection, 22, to transmit said records and information to said first computer. |
| Column 10 lines 8-10. | The controller, **20**, can also set the proper time into clock, **18**, should this step be necessary. | Page 290 lines 14-16.<br><br>Page 33 lines 18-21. | Automatically, controller, 20, checks the time of the clock, 18, of signal processor, 200, periodically. At a particular commence-enabling time that is a predetermined interval....<br><br>Controller, 20, has capacity for controlling the operation of all elements of the signal processor.... |
| Column 10 lines 10-13. | The controller, **20**, operates in a predetermined fashion that can be altered by external means communicating by means of the telephone connection, **22**. | Page 273 lines 16-25. | Said instruct-to-receive signal causes said first computer automatically to prepare to receive audit records then to transfer a particular start signal via connection, 22, to controller, 20. Receiving said start signal, sent automatically |

| | | | |
|---|---|---|---|
| | | | in response to controller, 20's, instruct-to-receive signal, causes controller, 20, to cause recorder, 16, to transmit all recorded meter audit records and particular other audit information to telephone connection, 22, which causes said connection, 22, to transmit said records and information to said first computer. |
| Column 10 line 14. | **Method of Use at an Intermediate Transmission Point** | *See generally* page 324 line 7 to page 390 line 11. | **Automating Intermediate Transmission Stations** |
| Column 10 lines 15-20. | The signal processing apparatus outlined in FIGS. **1**, **A**, **2B**, and **2C**, and their variants as appropriate, can be used to automate the operations of an intermediate transmission point whether it be a broadcast station transmitting only a single channel of programing or a cable system cablecasting many channels. | Page 324 lines 8-17. | The signal processing apparatus outlined in Figs. 2, 2A, 2B, 2C, and 2D, and their variants as appropriate, can be used to automate the operations of intermediate transmission stations that receive and retransmit programming. The stations so automated may transmit any form of electronically transmitted programming, including television, radio, print, data, and combined medium programming and may range in scale of operation from wireless broadcast stations that transmit a single programming transmission to cable systems that cablecast many channels simultaneously. |
| Column 10 lines 20-23. | They can be used in a facility transmitting television programing, radio programing, and making other electronic transmissions. | Page 324 lines 12-14. | ...stations so automated may transmit any form of electronically transmitted programming, including television, radio, print, data, and combined medium programming.... |
| Column 10 lines 24-28. | FIGS. **3A**, **3B** and **3C** illustrates one instance of such use. Figure **3** illustrates the use of Signal Processing Apparatus and Methods at a cable television system "head end" transmission facility that cablecasts several channels of television programing. | Page 324 lines 18-21. | Fig. 6 illustrates Signal Processing Apparatus and Methods at an intermediate transmission station that is a cable television system "head end" and that cablecasts several channels of television programming. |
| Column 10 lines 28-30. | The means for and method of transmission of programing described here is well known in the art. | Page 324 lines 21-23. | The means and methods for transmitting conventional programming are well known in the art. |
| Column 10 lines 30-39. | The facility receives programing from many sources. Transmissions may be received from satellites by satellite antenna, **50**, low noise amplifiers, **51** and **52**, and TV receivers, **53**, **54**, **55**, and **56**. Microwave transmissions can be received by microwave antenna, **57**, and television video and audio receivers, **58** and **59**. Conventional TV broadcast transmissions can be received by antenna, **60**, and TV demodulator, **61**. Other electronic programing input means, **62**, can receive programing transmissions. | Page 324 lines 23-31. | The station receives programming from many sources. Transmissions are received from a satellite by satellite antenna, 50, low noise amplifiers, 51 and 52, and TV receivers, 53, 54, 55, and 56. Microwave transmissions are received by microwave antenna, 57, and television video and audio receivers, 58 and 59. Conventional TV broadcast transmissions are received by antenna, 60, and TV demodulator, 61. Other electronic programming transmissions are received by other programming input means, 62. |

| | | | methods described above. |
| Column 12 lines 64-66. | Likewise, these methods are also applicable in a facility that transmits only a single channel of radio or television programing. | Page 339 lines 26-29. | This example has described methods at a multi-channel intermediate transmission station; the methods are also applicable in a station that transmits only a single channel of television, radio, broadcast print or data. |
| Column 12 line 67. | **Methods for Governing the Reception of Programing** | *See generally* page 278 line 22 to page 312 line 30.<br><br>*See generally* page 427 line 8 to page 447 line 23. | **Regulating the Reception and Use of Programming** |

**XIII. COLUMN 13**

| | | | |
|---|---|---|---|
| Column 13 lines 1-3. | FIGs **4A** through **4E** illustrate methods for governing the reception of programing and the use of signal processor apparatus in these methods. | Page 286 line 6. | Fig. 4 shows the Signal Processing Programming Reception and Use Regulating System .... |
| Column 13 lines 3-9. | All of these methods involve the use of one or more devices, of which various models exist well known in the art, for the decryption of programing transmissions and/or one or more other means for interrupting programing transmissions, also well known in the art, which may be as simple as a switch... | Page 286 line 34 to page 287 line 2. | Fig. 4 shows ... three decryptors, 107, 224 and 231, a signal stripper, 229, and , ...-associated with matrix switch, 258. |
| Column 13 lines 9-12. | ...and which may have means to interrupt programing by generating noise which noise may be an overlay of another audio and/or video transmission. | Page 279 lines 21-29. | Still other techniques, also well known in the art, involve controlling jamming means that spoil transmitted programming at stations that lack authorizing information or are determined not to be duly authorized, thereby degrading the usefulness of said programming. Such other techniques include, for example, inserting so-called "noise" into the transmitted programming which noise may be, for example, overlays of one or more separate transmissions. |
| Column 13 lines 13-14. | FIG **4A** shows a signal processor, **100**, and a programing decrypter and/or interrupt means, **101**,... | Page 287 lines 22-27. | As Fig. 4 shows, signal processor, 200, controls all the aforementioned apparatus. Signal processor, 200, controls ... matrix switch, 258; ... decryptors, 107, 224 and 230;.... |
| Column 13 lines 14-15. | ...each of which receives the same transmission of programing. | Page 299 lines 19-30. | Automatically, controller, 20, causes matrix switch, 258, to transfer the ... video ... from said tuner, 215, ... to decryptor, 224, thereby causing said decryptor, 224, to receive ... said video, and to transfer decrypted information of said video ... to matrix switch, 258. Automatically, controller, 20, causes matrix switch, 258, to transfer the information inputted from decryptor, 224, to ... signal processor, 200, .... |

|---|---|---|---|
| | enabled to receive the programing. | | 200, of Fig. 4 is preprogrammed at a particular time with particular information that indicates that the subscriber of said station wishes to view said "Wall Street Week" program when transmission of said program on cable cable 13 commences. (So preprogramming controller, 20, can occur in several fashions. For example, prior to a particular time, a subscriber may enter particular please-fully-enable-WSW-on- CC13-at-particular-8:30 information at local input, 225, and cause said information, in a predetermined fashion, to be inputted to controller, 20, by local input, 225. |
| Column 13 lines 39-40. | Local input, **102**, may also serve other purposes. | Page 395 lines 30-33. | Local input, 225, has capacity to input control instructions to signal processor, 200, and enables the subscriber of the station of Fig. 7 to manually input control instructions at any relevant time. |
| Column 13 lines 40-41. | Local input, **102**, may convey a continuous signal or an occassional signal or a one-time-only signal. | Page 289 lines 29-33.<br><br>Page 395 lines 30-33. | For example, prior to a particular time, a subscriber may enter particular please-fully-enable-WSW-on-CC13-at-particular-8:30 information at local input, 225, and cause said information, in a predetermined fashion, to be inputted to controller, 20, by local input, 225.<br><br>Local input, 225, has capacity to input control instructions to signal processor, 200, and enables the subscriber of the station of Fig. 7 to manually input control instructions at any relevant time. |
| Column 13 lines 42-43. | It may be activated by one or more switches or buttons or combinations. | Page 288 lines 9-13. | In the preferred embodiment, local input, 225, is actuated by keys that are depressed manually by the subscriber in the fashion of the keys of a so-called touch- tone telephone or the keys of a typewriter (or microcomputer) keyboard. |
| Column 13 lines 43-44. | It may be a computer acting in a predetermined fashion. | Page 288 lines 13-20. | As Fig. 4 shows, microcomputer, 205, also has capacity for inputting control information ..., and in the preferred embodiment, microcomputer, 205, may also automatically substitute for local control, 225, in predetermined fashions in inputting control information to said controller, 20, on the basis of preprogrammed instructions and information previously inputted to said microcomputer, 205. |
| Column 13 lines 44-47. | The signal may be input to signal processor, **100**, as described in FIG **1**, at buffer/comparator, **8**, or signal processor or monitor, **12**, or buffer/comparator, **14**. | Page 289 lines 29-33. | For example, prior to a particular time, a subscriber may enter particular please-fully-enable-WSW-on-CC13-at-particular-8:30 information at local input, 225, and cause said information, in a predetermined fashion, to be inputted to controller, 20, by local input, 225. |

| 1981 Spec Reference | 1981 Language | 1987 Spec Reference | 1987 Language |
|---|---|---|---|
| Column 13 lines 48-53. | In the preferred embodiment, local input, **102**, inputs a one-time signal to signal processor, **100**, at buffer/ comparator, **8**, and transmits information in a digital code signal which information is input to local input, **102**, in an alphanumeric form manually by means of buttons. | Page 288 lines 9-13. | In the preferred embodiment, local input, 225, is actuated by keys that are depressed manually by the subscriber in the fashion of the keys of a so-called touch- tone telephone or the keys of a typewriter (or microcomputer) keyboard. |
| Column 13 lines 54-56. | FIGs **4B** and **4C** illustrate various alternative ways that signals may be input to the signal processor, **100**, **103**, or **106** as applicable. | Page 286 lines 6-7.<br><br>Page 311 lines 17-28. | Fig. 4 shows the Signal Processing Programming Reception and Use Regulating System …<br><br>It is obvious to one of ordinary skill in the art that the foregoing is presented by way of example only and that the invention is not to be unduly restricted thereby since modifications may be made in the structure of the various parts without functionally departing from the spirit of the invention. … And for example, the transmitted programming may be processed through fewer than three steps of decryption or more than three. |
| Column 13 lines 56-60. | The fundamental point is that signals may be received in a manner that requires decryption and/or transmission by a decryptor/interruptor, **104**, before they reach the signal processor, as with signal processor **103** in FIG **4B**, | Page 299 lines 19-31. | Automatically, controller, 20, causes matrix switch, 258, to transfer the information of the aforementioned video … from said tuner, 215, … to decryptor, 224, thereby causing said decryptor, 224, to receive the information of said video portion … , to decrypt said information, and to transfer decrypted information of said video … to matrix switch, 258. Automatically, controller, 20, causes matrix switch, 258, to transfer the information inputted from decryptor, 224, to the output that that outputs to signal processor, 200, thereby causing signal processor, 200, to receive said information …. |
| Column 13 lines 60-61. | …or they may not, as with signal processor **100** in FIG **4A**,… | Page 291 lines 9-24.<br><br>Page 289 lines 25-27. | In the interval between said commence-enabling time and said 8:30 PM time, said head end is caused, … , to transmit a particular enabling SPAM message that consists of … particular enable-CC13 instructions and particular enable-WSW instructions that include particular enable-WSW-programming information, and an end of file signal **on the frequency of said master control channel.** (Hereinafter said message is called the "local-cable-enabling-message (#7).")<br>In the fashions described above, so transmitting said SPAM message causes signal processor, 200, at decoder, 30, (to which said master control channel is inputted), to detect the information of said message, ….<br><br>… said "Wall Street Week" program when transmission of said program on cable cable 13 commences. |

| 1981 Spec Reference | 1981 Language | 1987 Spec Reference | 1987 Language |
|---|---|---|---|
| | | Page 290 lines 28-29. | ...particular master cable control channel (that may or may not be cable channel 13) from the multi-channel cable system.... |
| Column 13 lines 61-62. | ...or some combination, as with signal processor **106** in FIG **4C**. | Page 291 lines 9-28. | In the interval between said commence-enabling time and said 8:30 PM time, said head end is caused, ... , to transmit a particular enabling SPAM message that consists of ... particular enable-CC13 instructions and particular enable-WSW instructions that include particular enable-WSW-programming information, and an end of file signal **on the frequency of said master control channel.** (Hereinafter said message is called the "local-cable-enabling-message (#7).")<br>In the fashions described above, so transmitting said SPAM message causes signal processor, 200, at decoder, 30, (to which said master control channel is inputted), to detect the information of said message, select the information of the execution segment in said message, and determine that said selected information matches the aforementioned instance of enable-next-program-on-CC13 information at said particular controlled-function-invoking information location. |
| | | Page 289 lines 25-27. | ... "Wall Street Week" program when transmission of said program on cable cable 13 commences. |
| | | Page 290 lines 28-29. | ...particular master cable control channel (that may or may not be cable channel 13) from the multi-channel cable system... |
| | | Page 299 lines 19-31 | Automatically, controller, 20, causes matrix switch, 258, to transfer the information of the aforementioned video ... from said tuner, 215, ... to decryptor, 224, thereby causing said decryptor, 224, to receive the information of said video portion ... , to decrypt said information, and to transfer decrypted information of said video ... to matrix switch, 258. Automatically, controller, 20, causes matrix switch, 258, to transfer the information inputted from decryptor, 224, to the output that that outputs to signal processor, 200, thereby causing signal processor, 200, to receive said information .... |
| Column 13 lines 63-68. | However, FIGs **4A**, **4B**, and **4C** do not fully illustrate this point because these figures do not reveal that the question of | Page 149 line 27 to page 150 line 6. | Decryptor, 10, commences receiving said information, decrypting it using said key J information and transferring it |

| 1981 Spec Reference | 1981 Language | 1987 Spec Reference | 1987 Language |
|---|---|---|---|
| | the need for decryption prior to reaching the signal processor depends, among other things, on where the signal or signals are placed in the incoming transmission. | | to controller, 12, as quickly as controller, 12, accepts it. The process of decryption proceeds in a particular fashion. Said decrypt-a-00-header-message instructions cause controller, 20, to cause decryptor, 10, to transfer the first H bits without decrypting or altering said bits in any fashion, to decrypt and transfer the next X bits, to transfer the next L bits without decrypting or altering said bits, to decrypt and transfer the next MMS-L bits, and finally, to transfer any bits remaining after the last of said MMS-L bits without decrypting or altering said bits. In this fashion, the cadence information in said message, which is not encrypted, is transferred by decryptor, 10, to controller, 12, without alteration. |
| Column 13 line 68 to column 14 line 1. | A decrypter does not necessarily decrypt the entire transmission. | Page 149 line 27 to page 150 line 6. | Decryptor, 10, commences receiving said information, decrypting it using said key J information and transferring it to controller, 12, as quickly as controller, 12, accepts it. The process of decryption proceeds in a particular fashion. Said decrypt-a-00-header-message instructions cause controller, 20, to cause decryptor, 10, to transfer the first H bits without decrypting or altering said bits in any fashion, to decrypt and transfer the next X bits, to transfer the next L bits without decrypting or altering said bits, to decrypt and transfer the next MMS-L bits, and finally, to transfer any bits remaining after the last of said MMS-L bits without decrypting or altering said bits. In this fashion, the cadence information in said message, which is not encrypted, is transferred by decryptor, 10, to controller, 12, without alteration. |

**XIV. COLUMN 14**

| | | | |
|---|---|---|---|
| Column 14 lines 1-2. | Encrypted transmissions may be only partially encrypted. | Page 288 line 30 to page 289 line 4. | In example #7, the program originating studio that originates the "Wall Street Week" transmission transmits a television signal that consists of so-called "digital video" and "digital audio," well known in the art. Prior to being transmitted, the digital video information is doubly encrypted, ... The digital audio is transmitted in the clear. |
| Column 14 lines 2-3. | For example, only the video portion of the transmission may be encrypted. | Page 288 line 33 to page 289 line 3. | Prior to being transmitted, the digital video information is doubly encrypted, ... The digital audio is transmitted in the clear. |
| Column 14 lines 4. | The audio portion may remain unencrypted. | Page 289 lines 3-4. | The digital audio is transmitted in the clear. |
| Column 14 lines 4-9. | In such a circumstance, a connection such as that shown in FIG **4B** could pass unencrypted signals to signal processor | Page 297 lines 20-32. | Subsequently, but still in the interval between said commence-enabling time and said 8:30 PM time, said |

|---|---|---|---|
| | | Page 50 lines 6-7. | information include:<br><br>...unique identifier codes for each program unit (including commercials);.... |
| Column 15 lines 63-65. | In the case of data transmitted to the micro- computer, they may be unique codes that identify the source and suppliers of the data. | Page 49 lines 26-28.<br><br>Page 50 lines 19-20. | Meter-monitor segments contain meter information and/or monitor information. Examples of categories of such information include:....<br><br>...unique codes that identify the sources and suppliers of computer data. |
| Column 15 lines 65-68. | In the case of data received at the printer, they may identify publications, articles, publishers, distributors, advertise ments, etc. | Page 425 lines 35 to page 426 line 1.<br><br>Page 421 lines 13-15. | ...and causes said AT&T news item to be printed at said printer, 221.<br><br>...meter-monitor segment that contains the "program unit identification code" information of said AT&T news item and subject matter information of said binary information of "T",.... |
| Column 15 line 68- Column 16 line 2. | The decoders, 131, 136, 138, 143, 145, 147, 149, and 150, may search for many types of codes, and the types described here provide only examples. | Page 50 lines 23-26. | The categories listed here provide only examples. Other types of information can exist in meter information and/or in monitor information, as will become apparent in this full specification. |

**XVI. COLUMN 16**

| | | | |
|---|---|---|---|
| Column 16 lines 3-4. | In FIG 5, each decoder receives every relevant signal received by its associated player or recorder unit. | Page 314 lines 34-35.<br><br>Page 315 lines 20-24. | At any given subscriber station, any given SPAM decoder may merely monitor the operation of its associated....<br><br>Each one of said decoders is preprogrammed to detect and transfer to said onboard controller, 14, via said bus means, the meter-monitor information of every unencrypted SPAM message in the transmission to which its associated apparatus is tuned. |
| Column 16 lines 5-10. | For example, TV set, 131, may receive programing from many sources including cable converter box, 133, video cassette recorder, 135, and videodisc player, 137. In every programing unit played on TV set, 132, TV decoder, 131, receives every signal for which it is instructed to search in a predetermined fashion and... | Page 313 lines 16-23. | Fig. 5 shows a variety of input apparatus with capacity for inputting programming (including SPAM information) selectively, via matrix switch, 258, to apparatus of the subscriber station of Fig. 5, intermediate apparatus with capacity for processing and/or recording inputted programming selectively, and output apparatus for displaying or otherwise outputting programming selectively to human senses. |

| | | | |
|---|---|---|---|
| | | Page 314 lines 20-28. | Associated with each intermediate apparatus and output apparatus is one or more appropriate decoders. ... At TV tuner, 215, is TV decoder, 282. ... At TV monitor, 202M, is TV decoder, 145. |
| Column 16 lines 10-11. | ...transfers the signals to signal processor, 130,... | Page 315 lines 6-8.<br><br>Page 315 lines 20-24. | Fig. 5 shows each decoder as having capacity for transferring monitor information to signal processor, 200, by bus communications means.<br><br>Each one of said decoders is preprogrammed to detect and transfer to said onboard controller, 14, via said bus means, the meter-monitor information of every unencrypted SPAM message in the transmission to which its associated apparatus is tuned. |
| Column 16 lines 11-13. | ...which has means to identify the source decoder from which each signal that it receives comes. | Page 322 lines 33-35.<br><br>Page 174 lines 4-14. | ...monitor information (#3) except that the source mark information identifies decoder, 282, rather than decoder, 203.<br><br>Under control of said instructions, said match causes control processor, 39J, to cause matrix switch, 39I, to commence transferring information from control processor, 39J, to buffer/comparator, 14, of signal processor, 200, (while said switch is simultaneously transferring information from control processor, 39J, to the CPU of microcomputer, 205); to transfer to said buffer/comparator, 14, header information that identifies a transmission of monitor information then particular decoder-203 information that is the source mark of said decoder, 203,.... |
| Column 16 lines 13-18. | On all programing recorded by video cassette recorder, 135, decoder, 136, receives every relevant signal and transfers such signals to signal processor 130. Radio signal decoder, 138, operates similarly for radio, 141. Other signal decoder, 143, for microcomputer 142. | Page 314 lines 20-26. | Associated with each intermediate apparatus and output apparatus is one or more appropriate decoders. At radio tuner & amplifier, 138, are radio decoder, 138, and other decoder, 281. ... At video recorder/player, 217, is TV decoder, 218. At microcomputer, 205, is TV decoder, 203. |
| Column 16 lines 18-21. | TV signal decoder, 145, for TV set, 144 (which may receive programing inputs and associated signals generated or transferred by microcomputer, 142). | Page 322 line 26 – Page 323 line 11. | The programming of said "Wall Street Week" program is received at tuner, 215, and displayed at monitor, 202M. Accordingly, transmitting said messages will also cause the decoder associated with tuner, 215-- decoder, 282--to detect, process, and transmit monitor information of said messages to onboard controller, 14A, that is identical to said 1st monitor information (#3) and 2nd monitor information (#3) except that the source mark information identifies decoder, 282, rather than decoder, 203. Likewise, unless the Fig. 1B information overlaid at microcomputer, 205, covers and obliterates the embedded information of said messages that is |

| | | | |
|---|---|---|---|
| | | | inputted from divider, 4, to microcomputer, 205, and would otherwise be transmitted to monitor, 202M, in the combined programming outputted by microcomputer, 205, (which covering and obliterating does not occur in example #3), transmitting said messages will also cause the decoder, 145, to detect, process, and transmit monitor information of said messages to onboard controller, 14A, that is also identical to said 1st and 2nd monitor information (#3) except that the source mark information identifies decoder, 145. |
| Column 16 lines 21-24. | Other signal decoder, 147, for printer 146. And TV signal decoders, 150 and 149, for each channel of programing received and displayed by multi-picture TV set, 148. | Page 314 lines 20-30. | Associated with each intermediate apparatus and output apparatus is one or more appropriate decoders. ... At multi-picture TV monitor, 148, are TV decoders, 149 and 150. ... At printer, 221, is other decoder, 227. |
| Column 16 lines 25-32. | One particular advantage of these methods for monitoring programing is that, by locating the identifier signals in the audio and/or video and/or other parts of the programing that are conventionally recorded by, for example, conventional video cassette recorders, these methods provide techniques for gathering statistics on what is recorded on video cassette recorders and on how people replay such recordings. | Page 319 lines 23-30. | One particular advantage of these methods for monitoring programming is that, by embedding the SPAM information in the audio and/or video and/or other parts of the programming that are conventionally recorded by, for example, conventional video cassette recorders, these methods provide techniques for gathering statistics on what is recorded, for example, on video and audio cassette recorders and on how people replay such recordings. |
| Column 16 lines 32-35. | For example, a person might instruct video cassette recorder, 135, automatically to record the NBC Network Nightly News as broadcast over station WNBC in New York City. | Page 319 lines 30-33. | For example, a subscriber might instruct video recorder/player, 217, automatically to record the NBC Network Nightly News as broadcast over station WNBC in New York City. |
| Column 16 lines 35-39. | Recorder, 135, might receive the programing over Manhattan Cable TV channel 4 and record the programing from 7:00 PM to 7:30 PM on the evening of July 15, 1985. | Page 319 line 33 – Page 320 line 2. | Recorder, 217, might receive the programming over Manhattan Cable TV channel 4 and record the programming at the time of original broadcast transmission--from 7:00 PM to 7:30 PM on the evening of July 15, 1985. |
| Column 16 lines 39-41. | Each discrete bit of this information could be conveyed to recorder, 135, in a signal unit or units in the programing so received and recorded. | Page 320 lines 2-8. | Each discrete bit of this information could be transmitted to the subscriber station of Fig. 5 in meter-monitor information ... embedded in the transmitted programming. So embedding and transmitting said meter-monitor information would cause recorder, 217, to record said information. |
| Column 16 lines 41-43. | Decoder, 136, would identify these signals and transfer them to signal processor, 130. | Page 320 lines 9-10. | ...decoder, 218, would detect said information and transfer said information to signal processor, 200, .... |
| Column 16 lines 43-45. | Subsequently, the person might play the recorded programing on TV set, 132, from 10:45 PM to 11:15 PM the same evening. | Page 320 lines 24-26. | Subsequently, the subscriber might play back the recorded programming and view said programming on TV monitor, 202M, from 10:45 PM to 11:15 PM the same evening. |
| Column 16 lines 45-47. | This time, TV signal decoder, 31, identifies the embedded signals and transfers them to signal processor, 131. | Page 320 lines 27-31. | So playing back and transmitting the recorded programming to monitor, 202M, would cause TV signal decoder, 145, to detect said meter-monitor information and transfer said |

| | | | |
|---|---|---|---|
| | | | information, together with appropriate source mark information, to signal processor, 131.... |
| Column 16 lines 47-49. | Prerecorded video cassettes and videodiscs could also contain unique embedded codes that would identify their usage... | Page 321 lines 1-5. | Prerecorded, commercially distributed video and audio tapes, videodiscs, so-called "compact discs" of audio, and so-called "CD ROM" discs of data can also contain unique codes, embedded in the prerecorded programming, that identify the use and usage of said programming.... |
| Column 16 lines 49-50. | ...(and could also transfer instructions to other external equipment). | Page 476 lines 18-22. | ...this method enables any subscriber who records the transmission of said programming at a recorder/player, 217, to access the embedded information of said instructions automatically in this fashion whenever the recorded transmission of said programming is played back.... |
| | | Page 473 lines 14-17. | At the station of Figs. 7 and 7F, said message is detected at TV signal decoder, 145, and said execution segment information invokes particular controlled function instructions that cause said message to be transferred.... |
| Column 16 lines 51-54. | Signal processor, 130, would probably receive these signals from decoders, 131, 136, 138, 143, 145, 147, 149, and 150) at its buffer/comparator unit, 14 (referring to FIG. 1),... | Page 315 lines 6-10. | Fig. 5 shows each decoder as having capacity for transferring monitor information to signal processor, 200, by bus communications means. Said information is received (and processed) at signal processor, 200, by the onboard controller, 14A, .... |
| | | Page 32 lines 24-33. | (In circumstances where information collecting and processing functions are extensive--for example, when a given buffer/comparator, 14, must collect monitor information at a subscriber station with apparatus and/or communications flows that are extensive and complex--buffer/comparator, 14, may operate under control of a dedicated, so-called "on-board" controller, 14A, at buffer/comparator, 14, which is preprogrammed with appropriate control instructions and is controlled by controller, 20, similarly to the fashion in which controller, 12 is controlled by controller, 20.) |
| Column 16 lines 54-56. | ...in a predetermined fashion that would permit signal processor, 130, to identify which decoder the individual signals come from... | Page 322 lines 33-35. | ...that the source mark information identifies decoder, 282, rather than decoder, 203. |
| | | Page 174 lines 4-17. | Under control of said instructions, said match causes control processor, 39J, ... to transfer to said buffer/comparator, 14, header information that identifies a transmission of monitor information then particular decoder-203 information that is the source mark of said decoder, 203,.... |

Figure **6D** also illustrates possible uses of a decrypter and a local input. | Page 469 lines 3-6. | Fig. 7F illustrates a method for generating and communicating information to selected subscribers through the coordination of computers, television, and broadcast print. Fig. 7F also illustrates use of a local input, 225. |
| Column 20 lines 16-23. | Suppose a viewer watches a television program on cooking techniques that is received on TV set, **202**, via box, **201**. Julia Childs's "The French Chef" is one such program. Halfway through the program, the host says, "If you are interested in cooking what we are preparing here and want a printed copy of the recipe for a charge of only 10 cents, press 567 on your Widget Signal Generator and Local Input." | Page 469 lines 7-8. | The microcomputer, 205, of the station of Fig. 7 and 7F, is preprogrammed to receive and process automatically.... |
| Column 20 lines 23-27. | The viewer then presses buttons 567 on local input, **225**, which signal is conveyed to the buffer/comparator, **8** (referring to Fig. **1**), of signal processor, **200**, to hold and process further in a predetermined fashion. | Page 471 lines 14-21. | Each subscriber--in particular, the subscriber of the station of Figs. 7 and 7F, said second subscriber, and said third subscriber--enters TV567#, in a fashion well known in the art, at the keyboard of the specific local input, 225, of his own station which causes said input, 225, to transmit a particular preprogrammed process-local-input instruction and said TV567# information to the controller, 20, of the signal processor, 200, of said station. |
| Column 20 lines 27-30. | Five minutes later, a signal is identified in the incoming programing on TV set, **202**, by decoder, **203**, which is also | Page 471 line 26 to page 472 line 4. | Five minutes later, said program originating studio embeds in the transmission of the "Exotic Meals of India" programming and |

| | | | |
|---|---|---|---|
| | transferred by processor, **204**, to buffer/comparator, **8**, of signal processor, **200**. | | transmits a particular first SPAM message that consists of an "01" header, particular execution segment information that is addressed to URS signal processors, 200, appropriate meter-monitor information, padding bits as required, an information segment of particular check-for-entered-information-and-process instructions, and an end of file signal.<br>At the station of Figs. 7 and 7F, said message is detected at TV signal decoder, 145, and said execution segment information invokes particular controlled function instructions that cause said message to be transferred to the controller, 20, of signal processor, 200. |
| Column 20 lines 31-33. | This signal instructs buffer/comparator, **8**, that, if 567 has been received from signal generator, **225**, signal processor, **200**, | Page 472 lines 13-23. | Receiving said message causes controller, 20, to load and execute said check-for-entered-information-and-process instructions, and executing said instructions causes controller, 20, to determine that TV567# information exists at said last-local-input-# memory and to cause an instance of particular covert control information (which is preprogrammed in said instructions) to be placed at particular control- function-invoking information memory of the controller, 39, of decoder, 145, and also at particular control-function- invoking information memory of the controller, 39, of decoder, 203. |
| Column 20 lines 33-37. | should, in a predetermined fashion, instruct tuner, **223**, to tune cable converter box, **222**, to the appropriate channel to receive the recipe in encoded digital form and instruct control means, **226**, to activate printer, **221**. | Page 477 lines 8-23. | In this alternate method, executing said check-for-entered-information-and-process instructions of said first SPAM message causes controller, 20, of signal processor, 200, of each one of said stations to cause the tuner, 223, of a selected converter box, 222, to tune said box, 222, to receive said second transmission; to cause the matrix switch, 258, to establish a programming communication link between said selected converter box, 222, and said decoder, 290; to cause the appropriate receiver apparatus of said decoder, 290, to receive said transmission and the appropriate detector and EOFS valve, 39F, to commence detecting an end of file signal; and to cause an instance of particular covert control information that is in said instruction to be placed at particular control-function- invoking information memory of the controller, 39, of said decoder, 290. |
| Column 20 lines 37-42. | The signal transmission from processor, **204**, also passes a signal word to signal processor, **200**, which, in a predetermined fashion, signal processor, **200**, decrypts and transfers to decrypter, **224**, to serve as the code upon which decrypter, **224**, will decrypt the incoming encrypted recipe. | Page 478 lines 1-5. | (Whichever transmission method is employed the information of said second message can be encrypted and caused to be decrypted in any of the methods described above--for example, in the method of the first message of example #4.) |
| Column 20 lines 42-46. | Then, as part of the predetermined operation, signal processor, | Page 472 lines 23-27. | Executing said instructions also causes controller, 20, to initiate a |

| 1981 Spec Reference | 1981 Language | 1987 Spec Reference | 1987 Language |
|---|---|---|---|
| | **200**, conveys to its data recorder, **16**, information that the 567 order was placed by the viewer and all necessary equipment was enabled. | | particular signal record of meter information at the buffer, 14, of signal processor, 200, which record contains particular program unit information and TV567# information. |
| Column 20 lines 46-48. | When the transmission of the recipe is received, box **222**, transfers the transmission to decrypter, **224**, for decryption | Page 473 lines 14-18<br><br>& lines 29-31. | At the station of Figs. 7 and 7F, said message is detected at TV signal decoder, 145, and said execution segment information invokes particular controlled function instructions that cause said message to be transferred to the controller, 39, of decoder, 203.<br><br>Receiving said message causes the controller, 39, of decoder, 203, to load and execute said generate-recipe-and- shopping-list instructions at microcomputer, 205, …. |
| Column 20 lines 48-49. | and thence to printer, **221**, for printing. | Page 475 lines 1-2. | Receiving said output information causes printer, 221, to print the information of said specific recipe and list. |
| Column 20 lines 49-54. | Other signal decoder, **227**, identifies a signal in the transmission received by printer, **221**, which it passes via processor, **228**, and buffer/comparator, **14**, of signal processor, **200**, to data recorder, **16**. This signal indicates that the recipe, itself, has been received. | Page 473 line 31 to page 474 line 1. | …shopping-list instructions at microcomputer, 205, and to transfer particular meter-monitor information to the buffer/comparator, 14, of signal processor, 200, causing said buffer/comparator, 14, to increment the information of said signal record of meter information in the fashion described above. |
| Column 20 lines 54-58. | Subsequently, when signal processor, **200**, transfers the data in its data recorder, **16**, via telephone to a remote site, that site can determine for billing purposes that the recipe was, first, ordered and, second, delivered. | Page 510 lines 28-32. | …causes controller, 20, in the fashion described above, to cause auto dialer, 24, to dial the telephone number, 1-(800) 247-8700. Automatically, in the fashion described above, controller, 20, establishes telephone communications with a computer of said super market…. |
| Column 20 lines 59-62. | (An alternate method for transmitting the recipe to printer, **221**, would be for the recipe, itself, to be located in encoded digital form in the programing transmission recieved by TV set, **202**. | Page 476 line 34 to page 477 line 3. | (An alternate method for inputting said second message to the microcomputers, 205, at stations where TV567# is entered at a local input, 225, is to embed said message in a particular second transmission that is different from the transmission…. |
| Column 20 lines 62-63. | In this case, decoder, **203**, would identify the signals conveying the recipe | Page 473 lines 14-18. | At the station of Figs. 7 and 7F, said message is detected at TV signal decoder, 145, and said execution segment information invokes particular controlled function instructions that cause said message to be transferred to the controller, 39, of decoder, 203. |
| Column 20 lines 63-65. | and transfer them via processor, **204**, to signal processor, **200**, which would decrypt them, itself, | Page 478 lines 1-5. | (Whichever transmission method is employed the information of said second message can be encrypted and caused to be decrypted in any of the methods described above--for example, in the method of the first message of example #4.) |
| Column 20 lines 65-67. | and transfer them, via means which in this case it would have, to printer, **221**). | Page 475 lines 1-2. | Receiving said output information causes printer, 221, to print the information of said specific recipe and list. |

|---|---|---|---|
| Column 22 lines 6-15. | It is obvious to one of ordinary skill in the art that the foregoing is presented by way of example only and that the invention is not to be unduly restricted thereby since modifications may be made in the structure of the various parts without functionally departing from the spirit of the invention. FIG **6** should make this clear. The receiver site depicted in FIG **6** has multiple means for receiving programing transmissions. All received programing is analyzed and evaluated by signal processor, **200**. | Page 556 line 33 to page 557 line 32. | It is obvious to one of ordinary skill in the art that the foregoing is presented by way of example only and that the invention is not to be unduly restricted thereby since modifications may be made in the structure of the various parts or in the methods of their functioning without functionally departing from the spirit of the invention. Any SPAM message and any other programming transmission can be caused, through encryption/decryption and other SPAM regulating techniques of the present invention, to take affect fully only selected stations and station apparatus. Because any transmission station can invoke any SPAM controlled function by transmitting a SPAM message with meter-monitor segment information, invoking any given SPAM controlled function can also cause meter information and or monitor information to be processed in the fashions described above at apparatus and stations where said controlled function is invoked. Intermediate transmission stations can be equipped with SPAM regulating capacity such as that illustrated in Fig. 4, monitoring capacity such as that illustrated in Fig. 5, and control information switching and bus communications capacity such as that illustrated in Figs. 7 and 8. Controlling such capacity by means of transmitted SPAM messages, a remote network origination and control station can transmit programming to intermediate transmission stations, regulate and meter the use of said programming at said stations, monitor the use and usage of said programming at said stations, and control communication of control information at said stations all in the fashions that apply above to ultimate receiver stations. And any given transmission station can cause its receiver stations to function automatically not only in the fashions described above in the sections on automating ultimate receiver stations but in any appropriate fashion that a network origination and control station can cause intermediate transmission stations to function automatically. |
| Column 22 lines 15-20. | Working with microcomputer, **205**, which is preprogramed to present received programing in predetermined fashions determined at the receiver site, signal processor, **200**, permits and facilitates such presentations in accordance with the intentions of the suppliers of the programing at remote sites. | Page 428 line 21 to page 429 line 17. | The program-unit-of-interest information preprogrammed at the microcomputer, 205, of the station of Figs. 7 and 7C includes particular specific-WSW information that reflects the wish of the subscriber of said station to view (or record) said "Wall Street Week" program when said program is transmitted. In a predetermined fashion, said subscriber has caused to be included in said program-unit-of-interest |

| | | | information. (Microcomputers, 205, of selected other stations of said large plurality of stations are also so preprogrammed.) The station-specific-television-program-selection-and-display instructions at the microcomputer, 205, of the station of Figs. 7 and 7C includes particular information that said subscriber will pay up to a certain limit--for example, twenty-five cents--to be permitted to receive said program and that, if the TV set, 202, of said station is switched off when information of the transmission of said program is detected, power should be switched on to said TV set, 202, and said program should be displayed at the monitor, 202M, of said set and, in addition, power should be switched on to the video recorder/player, 217, of said station, and said program should be recorded at said recorder/player, 217.<br>The signal processor, 200, of said station scans sequentially all received television transmission channels in the fashion described above and is preprogrammed at the RAM associated with the control processor, 39J, of its decoder, 30, to respond in a particular controlled function fashion whenever a SPAM message with an execution segment of particular available-television-program information is detected. Said signal processor, 200, has capacity for actuating and tuning TV set, 202, and video recorder, 217, and for controlling microcomputer, 205. |
| Column 22 lines 20-24. | Working together, signal processor, **200**, and microcomputer, **205**, can control all local equipment and manage local presentations in any fashion feasible given the nature of the local equipment and the programing. | Page 444 line 31 to page 445 line 22. | Automatically, controller, 20, transmits particular information to said decoder, 145, that causes said decoder, 145, to determine, in a predetermined fashion, that power is not on to monitor, 202M, and to respond by transmitting particular 202M-is-not-on information to controller, 20, via said link.<br>The fact that monitor, 202M, is not on signifies that the subscriber of the station of Fig. 7 is not viewing television information at monitor, 202M, and suggests that said subscriber may not even be present at said station.<br>Receiving said 202M-is-not-on information causes controller, 20, under control of said additional 2nd-stage-enable-WSW-program instructions, to cause microcomputer, 205, to input particular preprogrammed instructions to said controller, 20, which instructions reflect the the specific fashion in which said subscribe wants any given selected program to be selected and displayed. Automatically, |

| | | | controller, 20, inputs a particular choose-mode-of-selection-and-display instruction and said 202M-is-not-on information to microcomputer, 205, and receiving said instruction and said information causes microcomputer, 205, in a predetermined fashion, to process the aforementioned station- specific-television-program-selection-and-display instructions. Automatically, under control of said instructions, microcomputer, 205, inputs to controller, 20, particular preprogrammed display-at-202M-and-record-at-217 instructions. |
